

### Minor Spray Tanning Agreement 14-17 Years Old

- Using Pura maintenance products will preserve the life and value of my skin and my sunless tan.
- The product applied to my skin during my sunless application may have instant cosmetic bronzers. This color is only temporary and WILL WASH OFF.
- DHA is a clear ingredient and can take up to 24-hours to fully develop. During this time it is important to refrain from moisture build-up on the skin. (*i.e. swimming, rain, showering, sweating, massage & pedicure*).
- If you must shower prior to the 24-hour waiting period, use a warm water rinse only to freshen up. NOTE: *this will lessen the overall results of your tan.*
- Using bar soap or body san strip away your sunless spray tan.

#### FDA SPRAY TAN RECOMMENDATIONS

Precautionary Guidelines for spray tanning with DHA

The FDA has advised that all users of DHA spray tanning services avoid inhaling or ingesting DHA. When using all-over sunless tanning sprays containing DHA it may be difficult to avoid exposure to sensitive areas including eyes, lips, mucous membranes or internally.

The FDA along with Pura recommends you take the following protective measures during your sunless tanning session:

- Use of Protective Undergarments
- Using Protective Eyewear
- Use of Nose Filters
- Sealing Lips with Lip Balm

Please request the above items from your sunless technician.

If you have additional concerns, please consult with your health care provider. To understand the complete FDA stance on DHA please visit [www.FDA.gov](http://www.FDA.gov)

I understand the importance of the above steps and the information my technician has given me to achieve the perfect Pura spray tan.
